EMS System Guidelines
EMSA #160

State EMS Data Collection, Evaluation, and Quality Improvement System Overview

“The ability of EMS to optimally meet communities’ and individual patients’ needs in the future is dependent on evaluation processes that assess and improve the quality of EMS. Continuous evaluation is essential and should pervade all aspects of every EMS system.”

Theodore R. Delbridge MD, MPH

Introduction

In the above quotation from the 1996 National Highway Traffic Safety Administration’s (NHTSA) publication, *Emergency Medical Services, Agenda for the Future*¹, Dr. Delbridge stresses the importance of an effective evaluation and improvement system if EMS systems in this country are to be successful in the future.

This statement can be interpreted as containing both a “quality-of-care,” as well as an “economic” warning. When economies tighten at the federal, state, and local levels, it becomes extremely difficult to compete for limited healthcare dollars if EMS systems cannot definitively show their worth to the community. More importantly, the fact that EMS systems are administering medications and practicing invasive medical procedures carries with it a fiduciary responsibility to show that those systems are safe and effective for the patient being served, and to demonstrate what affect the EMS system has on the final outcome of the patient.

In an effort to encourage standardized data collection and system evaluation on a national level, NHTSA developed their original standardized EMS data set in 1993, which most states, including California, adopted. However, this data set lacked many of the necessary elements required for effective system evaluation, did not contain clear and concise definition for all data elements, and did not

1 NHTSA, *Agenda for the Future*, 1996; p57

1 include standardized quality indicators for which the data elements would be
2 used. Because the original NHTSA data set had its limitations, and because
3 many states did not have the resources or capability for large scale participation
4 in EMS data collection programs, no real effective data were produced on a
5 national level.

6
7 In July 1997, NHTSA released “A Leadership Guide to Quality Improvement (QI)
8 for EMS Systems” which has become a standard for EMS QI nationwide. In
9 addition, in April 2004, following a two-year development process, NHTSA
10 announced the release of a complete rewrite of their EMS data set entitled,
11 *NHTSA Uniform Prehospital Dataset, Version 2.1*. Even though this document
12 still does not contain standardized quality indicators for EMS, it does, along with
13 the 1997 QI Guide, provide a level of standardization in EMS evaluation and
14 improvement that has never existed before.

15
16 The leadership of NHTSA is important since their work finally provides a standard
17 for local EMS systems and EMS software vendors nationwide to utilize in their
18 data system designs. Without this leadership at the national level, software
19 vendors and state/local EMS offices would continue to develop new, non-
20 comparable and non-compatible data systems. With this new data set as a
21 foundation, those who choose to follow these standards will be able to produce
22 and compare data across local borders and state lines. Consistent with this
23 vision is a plan by the State EMS Director’s Association, in conjunction with
24 NHTSA, to develop a National EMS data repository and reporting system in the
25 next few years. NHTSA is also supporting the National EMS Performance
26 Indicators project (www.measureems.org) for development of a standardized
27 national set of EMS performance indicators, now in its early stages of
28 development.

29
30 With the foundation for a standardized approach to EMS system evaluation and
31 improvement in place at the national level, it has moved the challenge of
32 implementing these standards to the state level.

33 34 35 **History of EMS System Evaluation and Improvement in California**

36
37 By 1999, California had not been much more successful than the rest of the
38 nation in creating an effective EMS evaluation and improvement system. The
39 California EMS Vision Project, which was established by the EMS Authority and
40 EMS Commission in 1999, address several areas of perceived deficiency in the
41 EMS system in California, and identified the establishment of an effective,
42 standardized, data collection and quality improvement system among the top six
43 EMS needs within the state. The 1999 National Highway Traffic Safety

1 Administration's (NHTSA) evaluation of the California EMS system reiterated this
2 finding when they reported that there is, *"a lack of an integrated, statewide*
3 *information system that (has) the capability to monitor, evaluate and elucidate*
4 *emergency medical services and trauma care in California."*²
5

6 Much like the rest of the nation, California has had some success stories in local
7 system evaluation and improvement. In the 1980's and early 1990's, local EMS
8 agencies (LEMSAs) were encouraged, through the EMS System Guidelines and
9 special project funding, to develop data collection systems. However, without a
10 clear standard for how these systems should be designed and utilized, LEMSAs
11 developed their data collection systems independent of each other. While a state
12 data set (based on the original NHTSA data set) did exist, it was void of any
13 accompanying performance indicators, effective definitions, benchmarks, or
14 standardized reporting capabilities. The LEMSAs that did develop data systems
15 utilized their own definitions and data parameters. Consequently, they were only
16 able to measure their performance against themselves. With the exception of
17 some basic descriptive or structural data reporting capabilities, no comparative
18 analysis of performance from LEMSA to LEMSA, or on a statewide basis was
19 possible. In addition, even in areas where data was collected, it was not always
20 used effectively for quality improvement purposes. Through both the Vision
21 Process, and the NHTSA assessment, this was identified as an unacceptable
22 system deficit.
23

24 The Vision Process ran from 1999 to 2003. During that period, several multi-
25 agency groups, committees and task forces assisted in the development of the
26 EMS System Evaluation and Quality Improvement System outlined in EMSA
27 Series 160. Under the overall coordination of the "Vision Work Group D, *System*
28 *Evaluation and Improvement*," the *Paramedic Task Force*, *EMS Data Committee*
29 and many EMS Constituency groups were instrumental in creating the enclosed
30 documents. The ultimate goal of the project was to create an outline for a
31 comprehensive EMS system evaluation and improvement system in California
32 that was compatible with all national standards in force at the time. The results of
33 those years of work make up EMSA Guidelines #160 -168.
34

35 **Purpose and Format of the EMSA-160 Series Guidelines**

36
37 In reviewing the 160 series guidelines, the reader will notice that the concepts of
38 EMS system evaluation and EMS quality improvement are treated as a
39 continuum.
40

²NHTSA, *Assessment of Emergency Medical Services in California*; August, 1999; p30

1 *System Evaluation*, which consists of data collection, data analysis, and system
2 research, is futile from a quality of care perspective if that evaluation is not
3 reported and utilized for system improvement. Likewise, *EMS Quality*
4 *Improvement* cannot be effective if it is not based upon sound data and research.
5 Therefore, these two concepts are presented as a single process, broken down
6 into the components of Guidelines #161-168
7

8 The guidelines contained in the 160 series should provide the step-by-step
9 guidance necessary for a local EMS service provider, a LEMSA, or the State
10 EMS Authority to identify their specific roles and responsibilities in a standardized,
11 statewide EMS evaluation and improvement system. While some of the
12 documents necessary for a comprehensive program have not yet been completed
13 (these are identified in the *Table of Contents* in *gray italic print*), the documents
14 that are currently included provide the key elements necessary to establish and
15 implement effective data collection, and quality improvement programs at the
16 provider, LEMSA, base hospital and state levels.

17 Listed below is a brief description of each of the Guideline documents included in
18 the Table of Contents.

19 20 I. Evaluations of EMS Regulatory Agencies

21
22 **EMSA # 161 - State EMS Authority Assessment Guidelines** (Not yet
23 Developed)

24
25 **EMSA # 162 - Local EMS Agencies Assessment Guidelines** (Developed
26 but not validated or tested)

27
28 Besides stressing the needed for a sound evaluation and improvement
29 system, the NHTSA *EMS Agenda for the Future*, referenced in the
30 introduction of this document, also conveys the importance of assessing
31 “all aspects” of the EMS system. A comprehensive EMS CQI program must
32 include evaluation and ongoing improvement within all components of the
33 system, not just the medical care provided in the field and designated
34 receiving facilities. To this end, guidelines are being developed that
35 include evaluation and improvement of the services provided by the state’s
36 EMS administrative agencies. The evaluation would include the State EMS
37 Authority and local EMS agencies, to ensure that planning, implementation,
38 and monitoring functions are being performed efficiently and effectively,
39 and that the day-to-day duties of these agencies are supportive of the care
40 being provided in the field.
41
42
43
44

II EMS System Evaluation

EMSA # 163 – *State EMS System Performance Indicators*

Historically, EMS data collection system design has begun with the establishment of a data set which included those elements that the creators felt would be worthwhile for future reporting. It hasn't been until after the systems were developed that the reporting questions were actually asked of the system. Very often, because the software was not designed to answer a particular question, system modification and additional reprogramming would be necessary. As new questions were asked, new modifications were required.

To ensure that the amount of system modifications was kept to a minimum, prior to finalizing the California State EMS Data Set, a different approach was taken. Instead of building the data collection system, and then asking the questions, the process was reversed. The Vision Work Group D spent more than two years determining key questions that must be answered to ensure that all key components of the EMS system could be effectively evaluated. These questions were then translated into the *State EMS System Performance Indicators* (EMSA # 163). Only after these questions were carefully established was the State EMS Data Set (EMSA # 164) finalized. This approach has helped ensure that the necessary data elements to answer key system questions can be answered once the system is fully functional. However, even with the amount of time spent on the development of the Performance indicators, the Work Group was not able to complete all the performance indicators they set out to develop. Work on the development of new performance indicators will be on-going as EMS providers, LEMSAs and the State EMS Authority continue to refine and evolve their approaches to EMS performance improvement. When the initial version is fully completed, EMSA #163 should include standardized indicator definitions and minimum benchmark values to facilitate comparative analysis of local system performance, quality of patient care, customer satisfaction, and system cost on a local and state level. Once EMS Quality indicators have been established at the national level, it is anticipated that the California indicators will be revised to comply with those indicators.

EMSA # 164 - *State Data System Standards*

The State EMS Data Set consists of a comprehensive list of data elements and definitions consistent with two main sources. First it is in compliance with the *NHTSA Uniform Prehospital Dataset, Version 2.2.1*. Secondly, it

also contains the elements necessary for monitoring and evaluating the State EMS System Performance Indicators (EMSA # 163).

The State EMS Data Set contains the names of each data element, the source(s) from which the data can be obtained, and a detailed, practical operational definition of the element. Additionally, validation criteria have been developed to evaluate data quality and integrity at multiple points in the data collection, transfer, storage, and analysis process.

Some data elements are categorized as 'Core,' which means that those data elements must be collected for a given incident in circumstances where applicable. As an example, the date that the call was received would be considered to be a mandatory data element. In contrast, the name of the patient is not mandatory because in some circumstances, there may not be a 'patient' identified for a particular EMS response, such as an automobile crash where the vehicles and their occupants cleared the scene before any emergency responders arrived on-scene.

EMSA # 165 - State Data Collection and Reporting Guidelines (Under Development)

The State EMS Authority has established a statewide EMS data collection reporting system which has been named the California EMS Information System or CEMSIS. Once fully online, this system will be able to collect standardized data from all participating LEMSAs in the state and provide a web-based reporting capability for the public, LEMSAs, and service providers to utilize.

At first, this system will be able to collect Patient Care Record (PCR) and Computer-Aided Dispatch (CAD) data only. This will initially limit reporting capabilities to field operations and field care. However, the system is designed to be expanded to link with the *Office of Statewide Hospital Planning and Development* (OSHDP) which stores hospital and emergency department outcome data. Further expansion to include the *Department of Health Services* vital statistics data (e.g., death statistics), and the *California Highway Patrol* CRASH data is also included in the long term expansion plan. With these vital linkages, California will be well positioned to provide many different types of EMS patient outcome data that have never before been available.

EMSA # 165 is designed to provide the instructions and format for LEMSAs and local providers to follow in order to successfully up-load local

1 data into CEMSIS as well as how to utilize the web-based reporting
2 features. The system features will ultimately include:

- 3
- 4 • Process performance feedback via data reports to all participating
5 EMS agencies
- 6 • Maintenance of data confidentiality and security
- 7 • Mechanisms for feedback to prehospital personnel on the diagnosis
8 and disposition of their patients
- 9 • Collection and sharing of data among EMS system participants, to
10 include integration and linkage of data with other private, state, and
11 federal agencies, and organizations as appropriate.
- 12

13 **III. EMS System Quality Improvement**

14

15 **EMSA # 166 – State EMS System QI Program Model Guidelines**

16 EMSA # 166 follows the guidelines published in NHTSA's "Leadership
17 Guide to Quality Improvement (QI) for EMS System's." It includes
18 mechanisms to ensure that EMS performance data is utilized at the state,
19 local and provider level for continuous quality improvement aimed at
20 improving EMS services and quality of patient care, decreasing death and
21 disability, and reducing costs. It also establishes linkages with EMS
22 training and prevention programs to ensure that needs identified through
23 the evaluation process are integrated into EMS training curriculum and
24 prevention efforts. Finally, it provides an organizational structure and
25 standard operating procedures necessary to ensure maintenance of a
26 statewide EMS data collection, evaluation and quality improvement
27 process.

28

29 **IV. System Evaluation and Improvement Training**

30

31 **EMSA #167 – State EMS System Evaluation Training Guidelines** (To be 32 developed)

33

34 Once completed, the System Evaluation and Improvement Training
35 Guidelines will contain the recommended training modules for all levels of
36 EMS system personnel to ensure proper documentation, data entry,
37 analysis, utilization of data, and an understanding of the principles of
38 research. It is anticipated that there will be a module developed for EMT-
39 Is, EMT-Ps, and MICNs and a separate module for LEMSA and State
40 EMSA staff.

Ultimately, the curriculum developed for field personnel under this section, should be added to their initial training requirements.

V. EMS System Research

EMSA # 168 - EMS Research Guidelines (To be developed)

Once completed, the EMS System Research component of the California EMS QI Program will provide a response to the State EMS Commission's frequent expression of the need for guidelines for conducting and funding of State supported, or State required EMS research. The National EMS Research Agenda will be integrated into this process.

To that end, EMSA #168 should establish mechanisms to:

- Identify the various types of state required or state funded research that may be conducted to include: trial studies, treatment guideline effectiveness research, EMS system cost evaluation studies, patient outcome studies, etc.
- Identify the various research design methodologies practical for EMS such as quantitative, qualitative, survey, observation, historical, experimental, evaluation, etc.
- Identify current requirements and standards for conducting EMS research for each research design methodology identified.
- Establish a statewide IRB Process
- Develop criteria for EMS research based upon above standards which take into practical consideration research in rural areas with low study populations.
- Identify the types of research which should be given priority for state funded research projects.
- Develop minimum standards criteria for research projects to be funded by the State EMS Authority.
- Develop strategies which would encourage statewide EMS research projects that meet the minimum standards developed above.
- Identify all current barriers to conducting EMS research in California such as restrictions for prehospital human subject review
- Identify legislative/regulatory changes in bullet point format required to reduce identified barriers
- Identify areas of research outside of the realm of EMS that would benefit EMS

Future Needs

As mentioned before, the Table of Contents includes documents that are not yet completed. The unfinished documents were included in the Table of Contents to ensure that the vision of the comprehensive structure was not lost. As time and funding becomes available, those unfinished sections will be completed. Listed below, is a suggested order of priority for those projects in need of completion.

1. **Identify a standing *State EMS System Evaluation and Improvement Oversight Body* to coordinate implementation of the data, and QI efforts and coordinate future revisions to the statewide evaluation and improvement process.**
2. **Completion of the *State Data Collection and Reporting Guidelines* (EMSA #165) and submit to the State EMS Commission for adoption.**
3. **Implementation of the *State EMS System Quality Improvement Program Model Guidelines* (EMSA #166) throughout the state.**
4. **Completion of the *State EMS System Evaluation Training Guidelines* (EMSA # 167) to facilitate #1 above.**
5. **Conducting testing and validation of the *LEMSA Assessment Tool* (EMSA #162) and submit final tool to the State EMS Commission for adoption.**
6. **Completion of the *uncompleted quality indicators* (EMSA #163) to ensure a complete and comprehensive list of EMS evaluation indicators.**
7. **Completion and full utilization of the statewide CEMSIS data collection and web-based reporting capabilities.**
8. **Establishment of data linkages between CEMSIS and a) OSHPD Hospital Outcome and E.D. Data, b) DHS Vital Statistics Data, c) CHP/FEDERAL Crash Data.**
9. **Establishment of data downloads to the National EMS Data System once that system is established and functional.**
10. **Development of the *State EMS Authority Assessment Guidelines* (EMSA 161).**

1 **11. Development of *EMS Research Guidelines* (EMSA 168).**

2 **Conclusion**

3
4 By following the guidelines established in this Section, it is anticipated that EMS
5 service providers, LEMSAs, and the State EMS Authority will be able to, for the
6 first time, truly measure the effectiveness and worth of EMS systems in California,
7 and will be able to provide a comparative analysis between systems that was
8 never before possible.
9

10 The documents contained in this section are a best effort by all those involved. It
11 is a starting point. These documents will need to remain dynamic and be revised
12 as we collectively gain experience and knowledge on what constitutes effective
13 evaluation and quality improvement methodologies.
14
15
